

## Packet Tracer - Network Representation

### Objectives

The network model in this activity incorporates many of the technologies that you will master in your CCNA studies. It represents a simplified version of how a small to medium-sized business network might look. Feel free to explore the network on your own. When you are ready, proceed through the following steps and answer the questions.

**Note:** It is not important that you understand everything you see and do in this activity. Feel free to explore the network on your own. If you wish to proceed more systematically, follow the steps below. Answer the questions to the best of your ability.

### Instructions

#### Step 1: Identify common components of a network as represented in Packet Tracer.

The icon toolbar at the bottom left hand corner has various categories of networking components. You should see categories that correspond to intermediary devices, end devices, and media. The **Connections** category (with the lightning bolt icon) represents the networking media supported by Packet Tracer. There is also an **End Devices** category and two categories specific to Packet Tracer: **Custom Made Devices** and **Multiuser Connection**.

List the intermediary device categories.

routers, switchers, hubs, security and WAN emulation

Without entering into the internet cloud or intranet cloud, how many icons in the topology represent endpoint devices (only one connection leading to them)?

There are 15 end devices

Without counting the two clouds, how many icons in the topology represent intermediary devices (multiple connections leading to them)?

There are 11 interm devices

How many end devices are **not** desktop computers?

8 not desktop devices

How many different types of media connections are used in this network topology?

4 types of connections

#### Step 2: Explain the purpose of the devices.

- a. In Packet Tracer, only the Server-PT device can act as a server. Desktop or Laptop PCs cannot act as a server. Based on your studies so far, explain the client-server model.

the client server model is based on 2 main components which are server and computer(end device or client). the server provides network services for the end device to perform different tasks.

- b. List at least two functions of intermediary devices.

clasify and direct messages by their priorities

regenerate and retransmit communication signals

- c. List at least two criteria for choosing a network media type.

### Step 3: Compare and contrast LANs and WANs.

- a. Explain the difference between a LAN and a WAN. Give examples of each.  
LAN is a local network that is connecting lots of intermediary devices which connects end devices but WAN is a bigger network which connects different LAN infrastructures. a example of LAN is a home router that connects all the devices that uses network services. a WAN example could be a company that has more branches(buildings, not mandatory in the same country) and uses a WAN connection to connect all of those buildings from the point of view of network services.
- b. In the Packet Tracer network, how many WANs do you see?  
2
- c. How many LANs do you see?  
3
- d. The internet in this Packet Tracer network is overly simplified and does not represent the structure and form of the real internet. Briefly describe the internet.  
the internet is "WAN's bigger brother" as WAN is "LAN's bigger brother". by saying this i mean that the internet is a infrastructure that connects the WAN infrastructures around the globe.
- e. What are some of the common ways a home user connects to the internet?  
the home user uses cables, optical fiber and wireless connections
- f. What are some common methods that businesses use to connect to the internet in your area?  
i think they mostly use optical fiber, as it's the fastest available way to transmit signals because this method uses light pulses to transmit information.

### Challenge Question

Now that you have had an opportunity to explore the network represented in this Packet Tracer activity, you may have picked up a few skills that you would like to try out. Or maybe you would like the opportunity to explore this network in more detail. Realizing that most of what you see and experience in Packet Tracer is currently beyond your skill level, here are some challenges you might want to attempt. Do not worry if you cannot do them all. You will be a Packet Tracer master user and network designer soon enough.

- Add an end device to the topology and connect it to one of the LANs with a media connection. What else does this device need to send data to other end users? Can you provide the information? Is there a way to verify that you correctly connected the device?
- Add a new intermediary device to one of the networks and connect it to one of the LANs or WANs with a media connection. What else does this device need to serve as an intermediary to other devices in the network?
- Open a new instance of Packet Tracer. Create a new network with at least two LANs connected by a WAN. Connect all the devices. Investigate the original Packet Tracer activity to see what else you might need to do to make your new network functional. Record your thoughts and save your Packet Tracer file. You may want to revisit your network later after you have mastered a few more skills.
